influence of a journal is the Impact Factor. Since this factor only measures the average number of citations per article in a certain time window, it can be argued that it does not reflect the actual value of a periodical. This book defines five dimensions, which build a framework for a multidimensional method of journal evaluation. The author is winner of the Eugene Garfield Doctoral Dissertation Scholarship 2011.

Globalization is regarded as the key driver of growing container trade activities due to economic development. With a technology relying heavily on the combustion of fuel, international shipping is responsible for 2.7 percent of total world emissions and ocean transportation is becoming increasingly linked to environmental problems. The concepts of sustainability and greener shipping are expected to be

the prime focus of transportation in the coming decades, but the impending developments require a deep understanding of the emission impact and costs related to the inputs and outputs of world economies. This textbook quantifies and analyses atmospheric pollution for Hong Kong trade-lane specific container activities over the past decade using a new methodology, EcoTransIT World, a web-based application. Input data is generated from the Hong Kong Census & Statistics Department while emissions and energy consumption for the entire energy chain are measured as an output. Based on the findings, the costs to the society are estimated by an advanced top-down approach with a general market price for carbon. The results certainly indicate that the shift from long-distance to short-distance world container sourcing for laden container throughput has a positive

effect on the environment. Most notably, the estimated emission costs per container show a declining trend in opposition to the trade growth. The results provide unique trade-lane specific container emission factors and costs indications for Hong Kong shipping business that can be used for several purposes, such as: environmental performance control, benchmarking, policy making and the promotion and stimulation of green shipping to mitigate the environmental impact. The performance indicators represent a comprehensive picture of Hong Kong atmospheric pollution for different trade-lanes. Further studies and practical tools to gather real operating data from the original source such as ship owners and ocean carriers are required in future to verify the data. This will create awareness along global supply chains and crucially support the achievement of environmental

origin and places of demand for both passengers and freight. Almost three quarters of the world's surface is covered by water and around 80 percent of the world trade by weight is moved in this mode. Offshore trade activities (confined to container trade) describe a synonym that features globalization. In fact, transportation including these activities is the least visible critical element in world economies. But the importance of environment has barely been discussed in the context of pollution performance from individual economies. As a consequence, trade-lane (confined to specific world sea shipping routes between individual ports) emissions, generated by economies, are not precisely reviewed by government agencies. In addition, the real amount and costs of atmospheric pollutions linked to offshore trade-lane performance are not entirely understood by consumers.

Environmental awareness seems to be seldom raised in our society. In fact, the ignorance of mankind is the most important factor due to since appropriate information is very little available. Some emissions are contributing to a process of retaining the heat from solar radiation by the planet Earth also referred to as greenhouse effect . The greenhouse effect, which originally has a positive effect, because it makes the planet Earth warm enough to sustain life, is responsible for the increase of the global temperature which has quite apparent effects on our world. Melting sea ice effects and rising seawater levels are only a few examples. To be precise, freight transportation is responsible for approximately 25 percent of the total global transport emissions, equal to 1.65 billion tonnes of CO₂ per year. With increasing global demand in commodities and goods the magnitude of

transportation also rises, essentially addressing the consumer s and industry s need of delivering shipments with different, sizes, volumes, weight and requirements at the right place, to the right time, in the right quantity and to the right costs. From what has been said earlier it is curious why no generally accepted criterion to allocate international transportation pollution is currently in use. While diffident efforts were made to include these emissions in international conventions, CO2 emissions related to international freight are not involved in the pollution reduction goals of the [...]

History, and Public Policy examines whether competing interests can be reconciled while developing consistent, coherent, effective public policy to regulate uses and protection of the natural environment without destroying the national economy. It then reviews a range of possible solutions. The book delves into key normative concepts that undergird American perspectives on nature by providing an overview of philosophical concepts found in the western intellectual tradition, the presuppositions inherent in neoclassical economics, and anthropocentric (human-centered) and biocentric (earth-centered) positions on sustainability. It traces the evolution of attitudes about nature from the time of the Ancient Greeks through Europeans in the Middle Ages and the Renaissance, the Enlightenment and the American Founders, the nineteenth and twentieth

centuries, and up to the present. Building on this foundation, the author examines the political landscape as non-governmental organizations (NGOs), industry leaders, and government officials struggle to balance industrial development with environmental concerns. Outrageous claims, silly misrepresentations, bogus arguments, absurd contentions, and overblown prophecies of impending calamities are bandied about by many parties on all sides of the debate—industry spokespeople, elected representatives, unelected regulators, concerned citizens, and environmental NGOs alike. In lieu of descending into this morass, the author circumvents the silliness to explore the crucial issues through a more focused, disciplined approach. Rather than engage in acrimonious debate over minutiae, as so often occurs in the context of "green" claims, he recasts the issue in a way that

This edited volume examines the development path of eight Central and Eastern European countries with an overlapping historical background that joined the European Union between 2004 and 2013, and identifies the main similarities and differences between the countries concerned. Based on wide comparative data analysis of Bulgaria, Croatia, The Czech Republic, Hungary, Poland, Romania, Slovakia, and Slovenia, each chapter in the volume provides detailed information about the state of the economy in a specific area preceding the pandemic shock. The book offers a detailed snapshot of the state of the different areas of the economy, starting from the time when the countries

concerned came out of the 2008 financial crisis, up to the date when COVID-19 hit. Further, each chapter analyzes the effects of this unprecedented shock on a particular field, which is followed by highlighting the main problems the countries are facing at present and in the near future, together with identifying the available policy options. Finally, before concluding and making general and country-specific policy recommendations, some thoughts will be given to longer-term prospects. More specifically, the question of how the subject area could contribute to avoiding the "middle-income-trap" that this region may be facing will be addressed. The comprehensive approach makes this volume a must-read for scholars and students of economics, as well as policy decision-makers in Europe, interested in a better understanding of the region's economic development.

Free Radicals in Biology and Medicine has become a classic text in the field of free radical and antioxidant research. Now in its fifth edition, the book has been comprehensively rewritten and updated whilst maintaining the clarity of its predecessors. Two new chapters discuss 'in vivo' and 'dietary' antioxidants, the first emphasising the role of peroxiredoxins and integrated defence mechanisms which allow useful roles for ROS, and the second containing new information on the role of fruits, vegetables, and vitamins in health and disease. This new edition also contains expanded coverage of the mechanisms of oxidative damage to lipids, DNA, and proteins (and the repair of such damage), and the roles played by reactive species in signal transduction, cell survival, death, human reproduction, defence mechanisms of animals and plants against pathogens,

and other important biological events. The methodologies available to measure reactive species and oxidative damage (and their potential pitfalls) have been fully updated, as have the topics of phagocyte ROS production, NADPH oxidase enzymes, and toxicology. There is a detailed and critical evaluation of the role of free radicals and other reactive species in human diseases, especially cancer, cardiovascular, chronic inflammatory and neurodegenerative diseases. New aspects of ageing are discussed in the context of the free radical theory of ageing. This book is recommended as a comprehensive introduction to the field for students, educators, clinicians, and researchers. It will also be an invaluable companion to all those interested in the role of free radicals in the life and biomedical sciences.

Although the issue of offender decision-making pervades almost every discussion of crime and law enforcement, only a few comprehensive texts cover and integrate information about the role of decision-making in crime. The Oxford Handbook of Offender Decision Making provide high-quality reviews of the main paradigms in offender decision-making, such as rational choice theory and dual-process theory. It contains up-to-date reviews of empirical research on decision-making in a wide range of decision types including not only criminal initiation and desistance, but also choice of locations, times, targets, victims, methods as well as large variety crimes including homicide, robbery, domestic violence, burglary, street crime, sexual crimes, and cybercrime. Lastly, it provides in-depth treatments of the major methods used to study offender decision-making, including experiments, observation
