Salts are formed by the combination of acid and base through the neutralization reaction. The acidic and basic nature of salts usually depends on the acid and base from which the salt evolved in neutralization reaction. Example: $\text{NaOH} + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O}$

Salt is an ionic compound that results from the neutralization reaction of acids and bases. Salts are constituted of positively charged ions, known as cations and negatively charged ions, known as anions, which can either be organic or inorganic in nature. These ions are present in a relative amount, thus rendering the nature of the salt neutral.

Acids, Bases, and Salts - Introduction, Dissociation ...

Most salts do not form pH-neutral solutions. Salts such as sodium chloride that can be made by combining a strong acid (HCl) with a strong base (NaOH, KOH) have a neutral pH, but these are exceptions to the general rule that solutions of most salts are mildly acidic or alkaline. Salts of a strong base and a weak acid yield alkaline solutions.

A special property of acids and bases is their ability to neutralize the other's properties. In an acid-base (or neutralization) reaction, the H^+ ions from the acid and the OH^- ions from the base react to create water (H_2O). Another product of a neutralization reaction is an ionic compound called a salt.
