Advanced digital optical communications / Le Nguyen Binh ...

Optical communication, also known as optical telecommunication, is communication at a distance using light to carry information. It can be performed visually or by using electronic devices. The earliest basic forms of optical communication date back several millennia, while the earliest electrical device created to do so was the photophone, invented in 1880.

Optical communication - Wikipedia

At the detection point the demodulation can be easily done by using a photo detector, which converts optical energy into electrical energy results in original transmitted pattern. In advanced optical communication system, to achieve more than one bit per symbol transmits two level binary signals instead of one bit per symbol.
