Agile is a model of software development under which requirements and solutions evolve through the collaborative effort of self-organizing and cross-functional teams and their customers. In contrast, iterative is a model that starts with a simple implementation of a small set of software requirements and iteratively enhances the evolving versions until the complete system is implemented and ready to be deployed.

~~Waterfall vs. Agile vs. iterative development explained~~

Agile projects are iterative insofar as they intentionally allow for “repeating” software development activities, and for potentially “revisiting” the same work products (the phrase “planned rework” is sometimes used; refactoring is a good example). They are iterative in a third, less essential sense, in being most often structured around a series of iterations of fixed calendar length.
