Anti Diabetic And Other Pharmacological

For people with type 2 diabetes, diet and exercise may be enough to control blood glucose levels in some. However, when diet and exercise is no longer efficient, anti-diabetic drugs may be prescribed.

Medication will either be taken orally in the form of tablets (oral hypoglycemics), or be injected (insulin and GLP-1 receptor agonists).

Antidiabetic agents refer to all the different types of medicine involved in the treatment of diabetes. All these agents aim to reduce blood sugar levels to an acceptable range (called achieving normoglycemia) and relieve symptoms of diabetes such as thirst, excessive urination, and ketoacidosis (a serious complication of diabetes that occurs when the body cannot use glucose as a fuel source).

## Fighting Diabetes Mellitus: Pharmacological and Non-pharmaco

Drugs used in diabetes treat diabetes mellitus by altering the glucose level in the blood. With the exceptions of insulin, exenatide, liraglutide and pramlintide, all are administered orally and are thus also called oral hypoglycemic agents or oral antihyperglycemic agents. There are different classes of anti-diabetic drugs, and their selection depends on the nature of the diabetes, age and situation of the person, as well as other factors. Diabetes mellitus type 1 is a disease caused by the lac
