An automatic transmission system has a valve body, which serves as the main control center. The valve body has numerous passages and channels within the valve body. It allows the flow of hydraulic fluid to different valves to direct the right clutch and switch the gear appropriately according to the driving situation. The most important part of the valve body is the manual valve.

To shift properly, the automatic transmission has to know how hard the engine is working. There are two different ways that this is done. Some cars have a simple cable linkage connected to a throttle valve in the transmission. The further the gas pedal is pressed, the more pressure is put on the throttle valve.
