Cathodic protection is an electrical method of preventing corrosion on metallic structures situated in electrolytes. In practical applications, the structures most commonly provided with protection are constructed of iron or steel (including stainless steel) and the electrolytes are most often soil and water.

Cathodic protection (CP) is a technique used to control the corrosion of a metal surface by making it the cathode of an electrochemical cell. A simple method of protection connects the metal to be protected to a more easily corroded "sacrificial metal" to act as the anode. The sacrificial metal then corrodes instead of the protected metal.

Handbook of Cathodic Corrosion Protection: Theory and ...

The application of cathodic protection to reinforced concrete structures requires proper technical and economic considerations such as design and installation; determination of the state of corrosion of the reinforcing steel; assuming an extended electrical continuity through the reinforcing steel; making use of different concrete replacement systems for cathodic protection and proper maintenance; and commissioning and control of the cathodic protection.

Handbook of Cathodic Corrosion Protection | ScienceDirect

Cathodic Protection is a method of controlling corrosion and is based on electrochemical process. In this method, the corrosion of the cathode is achieved by concentrating the oxidation reaction in a galvanic cell at the anode. This method of Cathodic protection was first developed and used on a small scale in 1824 by Sir Humphrey Davy for protecting the British naval ships from corrosion.

Theory behind Impressed current cathodic protection

Cathodic protection is an electrical method of mitigating corrosion on metallic structures that are exposed to electrolytes such as soils and waters. Corrosion control is achieved by forcing a defined quantity of direct current to flow from auxiliary anodes, through the electrolyte, and onto the metal structure to be protected.

Chapter 2 Corrosion Theory and Corrosion Protection

Cathodic protection (CP) is a technique to control the corrosion of a metal surface by making that surface the cathode of an electrochemical cell. Cathodic protection systems are most commonly used to protect steel pipelines and tanks; steel pier piles, ships, and offshore oil platforms.

Corrosion - Wikipedia

Cathodic protection is defined as reduction or elimination of corrosion by making the metal a cathode by means of an impressed current or attachment to a sacrificial anode (usually magnesium, aluminum or zinc).¹² This is an electrochemical method that uses cathodic polarization to control the kinetics of the electrode processes occurring on the metal/electrolyte interface.

Basic Theory of Metallic Corrosion - Allied Corrosion ...

Corrosion theory involves four essential components: Cathode; Anode; Electrical connection that exists between the cathode and anode for the electron current flow; Electrolyte or a conducting environment to facilitate ionic movement; Specifically, corrosion can be used to describe any process that involves the degradation or deterioration of metal elements.

What is Corrosion Theory? - Definition from Corrosionpedia

Cathodic protection is a highly effective method of preventing corrosion, and is used in multiple industries and environments. Its history in corrosion science really begins when Sir Humphry Davy first discovered the cathodic protection principles and applied them to electrochemical corrosion.

Introducing Cathodic Protection - Institute of Corrosion

Electrochemical theory of corrosion can be taking iron as an example. When a metal like iron is exposed to the environment according to electrochemical theory corrosion of metal takes place due to the formation of anodic and cathodic regions on the same metal surface or when the two metals are in contact with each other in a corrosive medium.

Electrochemical theory of corrosion

Cathodic protection prevents corrosion by converting all of the anodic (active) sites on the metal surface to cathodic (passive) sites by supplying electrical current
