Pharmaceutical industry - Pharmaceutical industry - Drug discovery and development: A variety of approaches is employed to identify chemical compounds that may be developed and marketed. The current state of the chemical and biological sciences required for pharmaceutical development dictates that 5,000-10,000 chemical compounds must undergo laboratory screening for each new drug approved for use in humans.

Though these drugs differ chemically, interact with targets not traditionally considered "receptors", i.e. cognate sequences in RNA, and bind to their receptors via a mode different from small molecules, the technology has much more in common with small molecule drug discovery and development than those using monoclonal antibodies, protein replacement therapy, gene therapy or RNA therapy, all of which employ macromolecules as drugs (for review, see , , ,). Thus, to fully understand the ...

On average, developing a new drug takes 12 years and costs \$2.6 billion, with 9 out of 10 drugs entering clinical trials failing to enter the market.¹ While digital technology and big data have led to paradigm shifts in other sectors (think Netflix, Uber, and Amazon), the biopharmaceutical industry has been considered a laggard on the digital integration front.

~~Data and Digital Technology Trends in Drug Development~~

Drug development is the process of bringing a novel drug from "bench to bedside". It can take 10 to 15 years for a drug to be designed, developed and approved for use in patients (Fig 1). In some circumstances, the drug development and approval process can be expedited - for example, if the drug is the first available treatment for a condition , or it shows a significant benefit over existing drugs.

Scope of drug discovery technologies Before discussing innovation, the scope of drug discovery covered by this paper should be defined. The drug discovery process covers a broad range of disciplines from genomics and target discovery to pre-clinical testing. Within this space there are a variety of hardware, software and biological technologies.

Drug discovery and development The process of bringing a new medicine to market is extremely challenging, costing an average of \$2.6B and taking up to 12 years. It is therefore important for pharmaceutical companies to optimize the drug discovery and development process, to maximize the lifetime of the medicine before patents expire.

Drug development scientists in the pharmaceutical industry often look to academic laboratories for leadership and partnership in developing the tools needed to assess PD effects of drugs, as the technology for making these assessments (e.g. biochemical assays, imaging procedures, positron emission tomography ligands, evaluating the cargo of exosomes) is often not compound specific and may require scientific knowledge not readily available in a company.
