Heat Transfer Engineering: Vol 41, No 22

Heat transfer is an engineering discipline that concerns the generation, use, conversion, and exchange of heat (thermal energy) between physical systems. In power engineering it determines key parameters and materials of heat exchangers. Heat transfer is usually classified into various mechanisms, such as:

What is Heat Transfer - Definition - Thermal Engineering

Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy (heat) between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and transfer of energy by phase changes.

Heat transfer - Wikipedia

Heat transfer processes are classified into three types. The first is conduction, which is defined as transfer of heat occurring through intervening matter without bulk motion of the matter. Figure 1.1 shows the process pictorially. A solid (a block of metal, say) has one surface at a high temperature and one at a lower temperature.

PART 3 INTRODUCTION TO ENGINEERING HEAT TRANSFER

In thermal science, heat transfer is the passage of thermal energy from a hot to a cold body. When a physical body, e.g. an object or fluid, is at a different temperature than its surroundings or another body, transfer of thermal energy, also known as heat transfer, occurs in such a way that the body and the surroundings reach thermal equilibrium.

The surface temperature is 50 o C, the fluid temperature is 20 o C and the convective heat transfer coefficient is 2000 W/m 2o C). The convective heat transfer between the hotter surface and the colder air can be calculated as, q = (2000 W/(m 2o C)) ((1 m) (1 m)) ((50 o C) - (20 o C)) = 60000 (W) = 60 (kW) Convective Heat Transfer Calculator
