In mathematics, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. A graph in this context is made up of vertices which are connected by edges. A distinction is made between undirected graphs, where edges link two vertices symmetrically, and directed graphs, where edges link two vertices asymmetrically; see Graph for more detailed definitions and for other variations in the types of graph that are commonly considered. Graphs a

Tutte's work in graph theory includes the structure of cycle spaces and cut spaces, the size of maximum matchings and existence of k -factors in graphs, and Hamiltonian and non-Hamiltonian graphs. He disproved Tait's conjecture, on the Hamiltonicity of polyhedral graphs, by using the construction known as Tutte's fragment.

A simple graph that contains every possible edge between all the vertices is called a complete graph. A complete graph with n vertices is denoted as Kn. The first four complete graphs are given as examples: K1 K2 K3 K4 The graph G1 = (V1,E1) is a subgraph of G2 = (V2,E2) if 1. V1 ⊆V2 and 2. Every edge of G1 is also an edge of G2. 7

In graph theory, a cut is a partition of the vertices of a graph into two disjoint subsets.Any cut determines a cut-set, the set of edges that have one endpoint in each subset of the partition.These edges are said to cross the cut. In a connected graph, each cut-set determines a unique cut, and in some cases cuts are identified with their cut-sets rather than with their vertex partitions.
