The rate at which the chemical flows in is given by rate in  $= (5 \times 10^6) \text{ gal/yr} (2 + \sin 2t) \text{ g/gal}$ . (18) The concentration of chemical in the pond is  $Q(t)/107 \text{ g/gal}$ , so the rate of flow out is rate out  $= (5 \times 10^6) \text{ gal/yr} [Q(t)/107] \text{ g/gal} = Q(t)/2 \text{ g/yr}$ . (19) Thus we obtain the differential equation  $dQ/dt = (5 \times 10^6)(2 + \sin 2t) - Q(t)/2$ .

In this introductory course on Ordinary Differential Equations, we first provide basic terminologies on the theory of differential equations and then proceed to methods of solving various types of ordinary differential equations. We handle first order differential equations and then second order linear differential equations.

Unlike other books in the market, this second edition presents

differential equations consistent with the way scientists and engineers use modern methods in their work. Technology is used freely, with more emphasis on modeling, graphical representation, qualitative concepts, and geometric intuition than on theoretical issues. It also refers to larger-scale computations that computer algebra systems and DE solvers make possible. And more exercises and examples involving working with data and devising the model provide scientists and engineers with the tools needed to model complex real-world situations.

Elementary Differential Equations and Boundary Value Problems 11e, like its predecessors, is written from the viewpoint of the applied mathematician, whose interest in

differential equations may sometimes be quite theoretical, sometimes intensely practical, and often somewhere in between. The authors have sought to combine a sound and accurate (but not abstract) exposition of the elementary theory of differential equations with considerable material on methods of solution, analysis, and approximation that have proved useful in a wide variety of applications. While the general structure of the book remains unchanged, some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications. In addition to expanded explanations, the 11th edition includes new problems, updated figures and examples to help motivate students. The program is primarily intended for undergraduate students of mathematics,

The main prerequisite for engaging with the program is a working knowledge of calculus, gained from a normal two? or three? semester course sequence or its equivalent. Some familiarity with matrices will also be helpful in the chapters on systems of differential equations.
