In this study, analyses showed individuals with an internal locus of control were not only more likely to believe in a divine power, to admit a divine power helped them in the past, to ask for help from a divine power in the future, to attend places of worship more often than those who were external, but also that they were significantly more likely to maintain their religious beliefs and behaviors over a six year period compared to those with an external orientation.

Measures of Personality and Social Psychological Attitudes: Volume 1 in Measures of Social Psychological Attitudes Series provides a comprehensive guide to the most promising and useful measures of important social science concepts. This book is divided into 12 chapters and begins with a description of the Measures of Personality and Social Psychological Attitudes Project's background and the major criteria for scale construction. The subsequent chapters review measures of "response set"; the scales dealing with the most general affective states, including life satisfaction and happiness; and the measured of self-esteem. These topics are followed by discussions of measures of social anxiety, which is conceived a major inhibitor of social interaction, as well as the negative states of depression and loneliness. Other chapters examine the separate dimensions of alienation, the predictive value of interpersonal trust and attitudes in studies of occupational choice and racial attitude change, and the attitude scales related to locus of control. The final chapters look into the measures related to authoritarianism, androgyny, and values. This book is of great value to social and political scientists, psychologists, nurses, social workers, non-academic professionals, and students.

Since they began in 1955, the Duke Longitudinal Studies have aging have been regarded as landmark investigations, amassing invaluable data on the typical physical changes that accompany aging, typical patterns of mental health and mental illness, psychological aging, and the normal social roles, self-concepts, satisfactions, and adjustments to retirement of the aged. Comprising information on more than 750 aged and middle-aged persons, these studies have contributed enormously to our ability to distinguish normal and inevitable processes of aging from those that may accompany aging because of accident, stress, maladjustment, or disuse.

First published in 1982. Routledge is an imprint of Taylor & Francis, an informa company.

First published in 1990. Routledge is an imprint of Taylor & Francis, an informa company.

Originally published in 1986, the central topic of this book is the analysis and application of control-related beliefs and behaviours for theory and practice in the psychology of aging. The volume was written for two specific interrelated purposes aimed at cross-fertilization between the psychology of control and the field of gerontology. The first purpose was to summarise available research and theory on the psychology of control for researchers and professionals interested in gerontology at the time. The second was to enrich the field of the psychology of control.

The past few years have witnessed widespread acceptance of the notion that few elderly individuals are willing to stand by silently in the process of growing, and to relinquish whatever actual controls, autonomy or control beliefs they had in the past. Increasingly, old age is viewed as the dynamics of growth in mastery, control and self-efficacy, on the one hand, and a relative decline in psychological and physical resources on the other. It is the intent of this volume to communicate both aspects of these changes, and to offer a comprehensive review of the cross-fertilization of the field of gerontology and the psychology of reactance, freedom and control. Leading psychologists and social science researchers from the United States, Canada and Europe give their views on the meaning and application of control-related constructs having specific implications for the field of human aging. They address themselves to one or more of the major themes, issues or concerns which currently figure in discussions of control beliefs and control constructs as they apply to aging and old age. Written primarily for scholars, researchers and developmental theorists interested in the complexities and generativity of control constructs and their applications for the psychological well-being of older adults, the data and issues presented will be equally informative to gero-psychologists and mental health professionals concerned with healthy adaptive functioning of the elderly.

There is a growing body of scientific knowledge regarding development during the middle years which has so far been relegated to discipline-specific texts and journals (e.g., clinical psychology and endocrinology). Life in the Middle consolidates main findings across disciplines, with a life-span perspective regarding mid-life. Coverage includes individual development in middle age from the psychological and biological perspectives as well as the sociocultural context in which middle-aged individuals live and work, including physical health in mid-life, psychological well-being, cognitive development, the impact of work on the individual, and the general development of the "self." This age period is increasingly becoming the focus of scholarly attention as the largest cohort in U.S. history are now moving into the middle years (e.g., the "babyboomers"). From 1990 to 2015 the number of middle-aged people will increase 72 percent from 47 to 80 million. Contributors are outstanding scholars in the field of adult development Addresses critical theoretical issues in midlife Includes important contributions to our understanding of physical health at midlife Presents a thorough review of women's health at midlife Takes a holistic approach to biopsychosocial functioning at midlife
