This book provides readers with an up-to-date account of the use of machine learning frameworks, methodologies, algorithms and techniques in the context of computer-aided design (CAD) for very-large-scale integrated circuits (VLSI). Coverage includes the various machine learning methods used in lithography, physical design, yield prediction, post-silicon performance analysis, reliability and failure analysis, power and thermal analysis, analog design, logic synthesis, verification, and neuromorphic design. Provides up-to-date information on machine learning in VLSI CAD for device modeling, layout verifications, yield prediction, post-silicon validation, and reliability; Discusses the use of machine learning techniques in the context of analog and digital synthesis; Demonstrates how to formulate VLSI CAD objectives as machine learning problems and provides a comprehensive treatment of their efficient solutions; Discusses the tradeoff between the cost of collecting data and prediction accuracy and provides a methodology for using prior data to reduce cost of data collection in the design, testing and validation of both analog and digital VLSI designs. From the Foreword As the semiconductor industry embraces the rising swell of cognitive systems and edge intelligence, this book could serve as a harbinger and example of the osmosis that will exist between our cognitive structures and methods, on the one hand, and the hardware architectures and technologies that will support them, on the other....As we transition from the computing era to the cognitive one, it behooves us to remember the success story of VLSI CAD and to earnestly seek the help of the invisible hand so that our future cognitive systems are used to design more powerful cognitive systems. This book is very much aligned with this on-going transition from computing to cognition, and it is with deep pleasure that I recommend it to all those who are actively engaged in this exciting transformation. Dr. Ruchir Puri, IBM Fellow, IBM Watson CTO & Chief Architect, IBM T. J. Watson Research Center

' When it comes to training for climbing, you are your own experiment. ' Beastmaking by Ned Feehally is a book about training for climbing. It is designed to provide normal people — like you and me — with the tools we need to get the most out of our climbing. It is written by one of the world ' s top climbers and a co-founder of Beastmaker. It features sections on finger strength, fingerboarding, board training, mobility and core, and includes suggested exercises and workouts. There are insights from some of the world ' s top climbers, including Alex Honnold, Shauna Coxsey, Adam Ondra, Alex Puccio and Tomoa Narasaki. Free from jargon, it is intended to provide enough information for us to work out what we need to train, and to help us to train it.

In Vertical Mind, Don McGrath and Jeff Elison teach rock climbers how to improve their mental game so they can climb better and have more fun. They teach how the latest research in brain science and psychology can help you retrain your mind and body for higher levels of rock climbing performance, while also demonstrating how to train and overcome fears and anxiety that hold you back. Finally, they teach climbing partners how to engage in co-creative coaching and help each other improve as climbers.With numerous and practical step-by-step drills and exercises, in a simple to follow training framework, your path to harder climbing has never been clearer. If you are a climber who wants to climb harder and have more fun climbing, then Vertical Mind is required reading. Well, what's stopping you? Pick it up and get training today!

This unique reference features nearly all of the activities a typical CNC operator performs on a daily basis. Starting with overall descriptions and in-depth explanations of various features, it goes much further and is sure to be a valuable resource for anyone involved in CNC.
