If temporal bone pneumatization is limited, it is quite common to achieve a small self-cleaning cavity without the need for mastoid obliteration. However, combined mastoid and epitympanic obliteration in these cases may still be deemed advantageous as a means of repositioning the height of the tympanic membrane at the level of the native tympanic ring, thereby preserving normal middle ear volume and facilitating a successful ossiculoplasty.

Mastoid Cavity Obliteration | Ento Key

We present a method of combined BAHA and mastoid obliteration utilising the soft tissue from the BAHA soft tissue reduction to obliterate the cavity. This technique was used for

The mastoid is the part of your skull located behind your ear. It's filled with air cells made of bone and looks like a honey comb. The diseased cells are often the result of an ear infection that...

Mastoidectomy: Procedure, Complications, and Outlook

The mastoid bone has a honeycomb-like structure that contains air spaces called mastoid cells. Mastoiditis can develop if the mastoid cells become infected or inflamed, often following a persistent middle ear infection (otitis media). Cholesteatoma can also cause mastoiditis.
