## Architecture And Programming

Parallel computers can be roughly classified according to the level at which the hardware supports parallelism, with multi-core and multi-processor computers having multiple processing elements within a single machine, while clusters, MPPs, and grids use multiple computers to work on the same task. Specialized parallel computer architectures are sometimes used alongside traditional processors, for accelerating specific tasks.

fundamentals of the architecture of parallel computers and efficient programming for them. We will examine how architectures are designed to exploit and extract different types of parallelism. The focus will be on fundamentals, tradeoffs in parallel architecture design, and cutting-edge research. Architectures studied may include parallel microprocessors, GPUs and FPGAs. 3 PREREQUISITES

To solve different problems and tasks, SMP applies multiple processors to that one problem, known as parallel programming. However, there are a few limits on the scalability of SMP due to cache coherence and shared objects. Programming. Uniprocessor and SMP systems require different programming methods to achieve maximum performance.
