Achilles Tenotomy (Percutaneous Heel Cord Tenotomy) The Achilles tenotomy is an integral part of Ponseti management of clubfoot. Tenotomy is necessary because the Achilles tendon, unlike the ligaments of the foot, is made up of thick, non-stretchable fibres. After the tenotomy the foot is placed in a final cast in an over-corrected position of maximal abduction and dorsiflexion.

A percutaneous tenotomy is an orthopedic procedure used to treat patients who have chronic shoulder, hip, knee, elbow, or ankle pain associated with a damaged tendon. Risks associated with a percutaneous tenotomy include infection, temporary nerve injury, or temporary soreness at the treatment site. Benefits of a percutaneous tenotomy over surgery include quicker recovery, no stitches necessary, minimally scarring, and pain relief.
