Exponent is the number of times a number is multiplied by itself. Exponents are written as x^y ; where x is the number and y is the exponent or power. Example: $2 * 2 * 2 * 2 * 2 = 2^5$ The n th root of a number x is a number r which, when raised to the power of n , equals x . i.e $r^n = x$ In the above example $2^5 = 32$, hence 2 is the 5th root of 32. Learn more about powers and roots.

Find the value of the following powers: a. $6^2 = 6 \times 6 = 36$. b. $3^5 = 3 \times 3 \times 3 \times 3 \times 3 = 243$. c. $2^7 = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 = 128$. d. $2^8 = 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 = 256$. You already know from part c that $2^7 = 128$, so multiply this number by 2 to get your answer: $128 \times 2 = 256$. Find the value of the following powers: a. $10^4 = 10,000$.

Exponents []. Exponents, or powers, are a way of indicating that a quantity is to be multiplied by itself some number of times. In the expression 2^5 , 2 is called the base and 5 is called the exponent, or power. 2^5 is shorthand for "multiply five twos together": $2^5 = 2 \times 2 \times 2 \times 2 \times 2 = 32$. Notice that the exponent tells us how many bases to multiply, not how many multiplications to perform.

Roots and Radicals. We use the radical sign: $\sqrt{\quad}$ It means "square root". The square root is actually a fractional index and is equivalent to raising a number to the power $1/2$. So, for example: $25^{(1/2)} = \sqrt{25} = 5$ You can also have. Cube root: $\sqrt[3]{x}$ (which is equivalent to raising to the power $1/3$), and

~~4. Powers, Roots and Radicals – intmath.com~~

Powers and Roots: Square Roots. By Mike M Garry on October 24, 2018, UPDATED ON November 15, 2018, in Powers and Roots, Video Lessons. ... So if we take a square root of those three numbers that tells us that the square root of 41 has to be between 6 and 7. And so that 's the kind of approximating that the test would expect you to be able to do.
