General principles of crop production. Crops of the grass family. Legumes. Crop of other plant families.

Commercial crop production in the 21st century is a highly technical pursuit. There is an economic imperative for farmers to make a reasonable living through increased productivity, cost containment and market satisfaction. Contending with the variability of the Australian climate remains a major challenge. Of increasing importance is the environmental imperative - the need to manage soil structure decline, erosion, acidity and salinity. Involved also are biodiversity preservation and the water reform agenda. The fourth edition of Principles of Field Crop Production addresses these issues and provides a contemporary understanding involved in the production of crops in Australia. The book provides background on the evolution of farming systems. A new chapter on climate variability and its predictability is included as are new treatments of rotations, weeds, pests and diseases. An introduction to supply chain management provides the reader with an understanding of market forces. All chapters have been updated and the principles clearly defined.

Commercial crop production in the 1990s involves a series of complicated decisions. The range of pressures which now impact on the modern farmer has increased significantly in recent times. Farmers no longer can rely on the production of commodities but must focus on products, the quality of which must meet market requirements. Economic pressures necessitate an increase in productivity if farmers are to survive financially. At the same time, the community demands that farmers maintain the natural resource base of the land of which they are custodians and that they minimise the inputs of chemicals. Principles of Field Crop Production concentrates on the principles associated with farming and addresses the issues of raising productivity and environmental management. This book also endeavours to put crop production in a broader perspective by addressing issues such as the socioeconomic aspects and crop improvement issues relevant to the scope of the book. This new edition updates information on numerous crops, and provides new insights into farming systems and modern breeding methods such as genetic engineering. This new edition continues to fill an important niche for both tertiary and senior secondary students of agronomy and their teachers. It is also an important reference book for research workers and for others involved or interested in agriculture.
