This classic work chronicles how New York, London, and Tokyo became command centers for the global economy and in the process underwent a series of massive and parallel changes. What distinguishes Sassen's theoretical framework is the emphasis on the formation of cross-border dynamics through which these cities and the growing number of other global cities begin to form strategic transnational networks. All the core data in this new edition have been updated, while the preface and epilogue discuss the relevant trends in globalization since the book originally came out in 1991.

A unique comparative study based on funded research, of eleven city regions across three continents looking at changes over the last 30 years. Detailed changes in land use are presented here with series of maps prepared especially for the study. The socio-economic and physical forms of city regions have been examined for comparative study and the findings will be of interest to all those concerned with urban development in their professional and academic work. The book features numerous maps which underline research findings. Cities covered are: Ankara, Bangkok, Boston, Madrid, Randstad, San Diego, Chile, Sao Paulo, Seattle and the Central Puget, Taipei, Tokyo, West Midlands.

In her groundbreaking book, sociologist Saskia Sassen identifies two sets of processes that make up globalization. One is the set of global institutions, such as the World Trade Organization, global financial markets, the War Crimes Tribunals and the new global cosmopolitanism. However, there is a second set of processes, frequently ignored by most social scientists, that occur on the national and local level. These processes can include state monetary and fiscal policy, networks of activists engaged in local struggles that have an explicit or implicit global agenda, and local and national politics that are unknowingly part of global networks containing similar localized efforts. Sassen's new book focuses on the importance of place, scale and the meaning of the national to study globalization. By emphasizing the interplay between the global and the local, A Sociology of Globalization introduces readers to new forms and conditions such as global cities, transnational communities and commodity chains that are increasingly common. Sassen's expanded approach to globalization offers new interpretive and analytic tools to understand the complex ideas of global interdependence.

Cities are gaining importance and influence worldwide. They sustain the global economy, set cultural trends, produce greenhouse gas emissions and consume energy; they attract migration flows and foster new political waves. While cities were supposed to be declining back in the 1980s, the globalised economy has established them as crucial world hubs leading billions of people on every continent, both at the top and the bottom of the social ladder, to move to cities.

Today, global cities cry out for a more prominent role. But why and to what extent do they matter? Can they really stand alone in the global arena? How are they interacting with governments and multilateral organisations? From climate change to connectivity, from inequalities to migration: what is their contribution to key global challenges?

The papers collected in this volume discuss the sensory dimension of cityscapes, with focus on touch and smell. Both have been traditionally considered "lower senses" and thus unworthy of being cultivated - objects of social prohibitions and targets of suppressing strategies in modern architecture and city planning. The book brings together approaches from anthropology, aesthetics, the theory of architecture, art and design research, psychophysiology, ethology, analytic chemistry, etc. (Series: Austria: Forschung und Wissenschaft – Interdisziplinär - Vol. 4)

Through a reading of periodicals, memoirs, speeches, and fiction from the antebellum period to the Harlem Renaissance, this study re-examines various myths about a U.S. progressive history and about an African American counter history in terms of race, democracy, and citizenship. Reframing 19th century and early 20th-century African-American cultural history from the borderlands of the U.S. empire where many African Americans lived, worked and sought refuge, Knadler argues that these writers developed a complicated and layered transnational and creolized political consciousness that challenged dominant ideas of the nation and citizenship. Writing from multicultural contact zones, these writers forged a "new black politics"—one that anticipated the current debate about national identity and citizenship in a twenty-first century global society. As Knadler argues, they defined, created, and deployed an alternative political language to re-imagine U.S. citizenship and its related ideas of national belonging, patriotism, natural rights, and democratic agency.

Integral Urbanism is an ambitious and forward-looking theory of urbanism that offers a new model of urban life. Nan Ellin's model stands as an antidote to the pervasive problems engendered by modern and postmodern urban planning and architecture: sprawl, anomie, a pervasive culture - and architecture - of fear in cities, and a disregard for environmental issues. Instead of the reactive and escapist tendencies characterizing so much contemporary urban development, Ellin champions an 'integral' approach that reverses the fragmentation of our landscapes and lives through proactive design solutions.

London continues to fascinate a vast audience across the world, and an extensive, diverse literature now exists describing and analyzing this metropolis. The central question - what is London? - has produced many answers but none of them, the author argues, uncovers the complex ways in which knowledge is constructed in the diverse attempts to represent places and people. On the contrary: a gulf has opened up between analysis of contemporary London as a global, postcolonial city, on the one hand, and historical accounts of the imperial capital on the other. The author shows how the gap can be bridged by combining an analysis of the representation over time by various experts of London and certain localities with an investigation of the ways in which residents have represented their communities through struggles over symbolic and material resources.

Cities in a World Economy examines the emergence of global cities as a new social formation. As sites of rapid and widespread developments in the areas of finance, information and people, global cities lie at the core of the major processes of globalization. The book features a cross-disciplinary approach to urban sociology using global examples, and discusses the impact of global processes on the social structure of cities. The Fifth Edition reflects the most current data available and explores recent debates such as the role of cities in mitigating environmental problems, the global refugee crisis, Brexit, and the rise of Donald Trump in the United States.

Recent years have witnessed a surge in public awareness concerning the impact of world economic forces on cities. In this challenging book, the author argues that though the consciousness is new the phenomena themselves are not. For the past two centuries at least, world economic, political and cultural forces have been major factors shaping cities, patterns of urbanization and the physical and spatial forms of the built environment. Anthony King believes that the historical context of contemporary global restructuring must be recognized if present-day urban and regional change is to be properly understood. He explores and documents the cultural and spatial links between metropolitan core and colonial periphery and examines the historical foundations of the world urban system. He also looks at the social production of building and urban form, and demonstrates their potential for understanding economic, political, social and cultural change on a global scale.
