Steel structures is a very important subject for undergraduate civil engineers. Steel is an alloy of carbon and iron. It used in construction and other applications because of its Hardness and tensile strength. Due to the tensile strength of steel, it is added in concrete otherwise concrete is very much powerful in compression. Many of the structures in the whole world are made of steel.

One of the useful mechanical properties of steel is its ability to change shape on the application of force to it, without resulting in a fracture. This property is known as ductility, which enables it to be used in the making of different shapes and structures ranging from thin wires or large automotive parts and panels. 3- Malleability
