The Beal Conjecture A Proof

The conjecture was formulated in 1993 by Andrew Beal, a banker and amateur mathematician, while investigating generalizations of Fermat's last theorem. Since 1997, Beal has offered a monetary prize for a peer-reviewed proof of this conjecture or a counterexample. The value of the prize has increased several times and is currently \$1 million.

Beal conjecture - Wikipedia

BEAL'S CONJECTURE: If  $A^x + B^y = C^z$ , where  $A, B, C, x, y$  and  $z$  are positive integers and  $x, y$  and  $z$  are all greater than 2, then  $A, B$  and  $C$  must have a common prime factor. In the fall of 1994, Andy Beal wrote letters about his work to

## The Beal Conjecture

Beal's Conjecture A generalization of Fermat's last theorem which states that if , where , , , , and are any positive integers with , then , , and have a common factor.

The conjecture was announced in Mauldin (1997), and a cash prize of has been offered for its proof or a counterexample (Castelvecchi 2013).

## The Beal Conjecture

Beal's Conjecture Revisited¶ In 1637, Pierre de Fermat wrote in the margin of a book that he had a proof of his famous "Last Theorem": If  $A^n + B^n = C^n$ , where  $A, B, C, n$  are positive integers then  $n \leq 2$ . Centuries passed before Andrew Beal, a businessman and amateur mathematician, made his conjecture in 1993: If  $A^x + B^y = C^z$ ,

Conjecture

Mr. Andrew Beal, in our view, is correct in his conjecture. If one employs the algebraic notation of the conjecture based on selfsame multiplication, then, the proof of the conjecture is as stated by Mr. Beal, and there are no counterexamples. By using selfsame addition, one may observe the innumerable counterexamples.
