In this thesis I present a theoretical model for predicting the noise produced by rainfall on a flat inclined roof. A recently published method for predicting droplet impact forces is incorporated into the model and a novel model is proposed which accounts for the effect of surface inclination on the droplet force. The results of an experimental study investigating the droplet impact force on both a flat and and inclined surface are also presented and validate the proposed model. The droplet force model is compared with other force models available in the literature. The radiated sound power is predicted using the recently proposed model of Davy [1]. These predictions are compared with a series of experiments performed using a method based on that described in the ISO rainfall noise standard showing generally good agreement. Also an investigation into an observed relationship between rainfall impact noise and the airborne sound reduction index of roofs is described, and shows results comparable to those reported in a similar study described in ref. [2].

This study represents attempts dating from 1967, by nine experts on Communist economics, to forecast the performance of

individual Communist countries. These predictions provide a great deal of comparable information and make experimental use of elementary econometrical techniques, which have rarely been applied to these countries before. The book also contains, as a unique feature, criticism and self-criticism of the predictions of 1967 (here reproduced unchanged) in the light of subsequent events. A most valuable by-product is the analytical comparison of planning procedures and of agricultural ownership, country by country, so that the differing progress of the reforms can be easily grasped.

Predicting water runoff in ungauged water catchment areas is vital to practical applications such as the design of drainage infrastructure and flooding defences, runoff forecasting, and for catchment management tasks such as water allocation and climate impact analysis. This full colour book offers an impressive synthesis of decades of international research, forming a holistic approach to catchment hydrology and providing a one-stop resource for hydrologists in both developed and developing countries. Topics include data for runoff regionalisation, the prediction of runoff hydrographs, flow duration curves, flow paths and residence times, annual and seasonal runoff, and floods. Illustrated with many case studies and including a final chapter on recommendations for researchers and practitioners, this book is written by expert authors involved in the prestigious IAHS PUB initiative. It is a key resource for academic researchers and professionals in the fields of hydrology, hydrogeology, ecology, geography, soil science, and environmental and civil engineering.

Every new PBS field is confirmed with planar dose measurements at two water-equivalent depths, proximal (D1) and tumor (D2), with field-specific devices in our clinic. This study aims to predict PSQA results whether above or below the pass-criteria, greater than 90% of comparisons points having uf067-index (3 mm and 3% with 10% dose-threshold) within uf0b11, with a TOPAS MC beam model and therefore to omit the measurements for the fields that MC predicts pass. MC simulations were performed for 883 PBS fields and used to predict QA outcome for analytically calculated dose distributions. A total of 96% and 98.7% among pass predictions for D1 and D2 were observed pass by the measurements from Figure 1. However, MC exhibited low performance on correctly predicting failure fields as 47% (27 of 56) and 18% (2 of 11) for D1 and D2 respectively. The correlation coefficients between the prediction and observation were 0.32 for D1 and 0.11 for D2. The high precision but marginal correlations implied that our MC model is more effective to predict pass incidents than failure incidents. Because MC unlikely (1/883) mis-predicted D1 and D2 simultaneously, it is suggested to measure all D2 and for only D1 fields that MC predicts fail. In this scenario, 90% of D1 measurements are expected to be replaced by MC without compromising the risk associated from the omitted the measurements. This study experimentally confirmed the MC simulations can be used to reduce the number of QA measurements in pencil beam scanning in proton therapy.

Nobody knows the day they'll die... until now. Mathematical genius Daniel Geller has developed a formula to predict a person's date of death only to have it rejected by the faculty at Trinity College. Totally devastated he turns his back on the world he once loved. Twelve years on, Daniel's old professor John Redmond and his wife are coming to terms with the death of their ten-year-old son. Could Daniel's formula have predicated his death? Revisiting the thesis, the professor makes an astonishing discovery: out of the five fellow students whom Daniel used the formula on, one of them died on the exact date predicted by Daniel. One more is due to die in six days: Daniel's ex-lover Grace. The professor draws Daniel back into the world of mathematics where he is suddenly faced with the dilemma of allowing someone he once loved to die to be one step closer to proving his thesis and enjoying a prestige he once dreamed of... Set in the vibrant cities of Dublin and Amsterdam, The Prediction is a powerful story about coping with shattered dreams, the loss of a loved one, and an illustration of just how unpredictable the human heart can be. http: //www.darrensugrue.com/
