Muscles and joints are an important part of the musculoskeletal system. The structure of articulating surfaces and the type of connective tissues play a significant role in the range and plane of movement permitted at the joint. Skeletal muscles are responsible for movement and posture, and work best when used regularly to prevent atrophy.

Subsidence, settlement, heave, sway, bouncy floors, bulging walls, cracks, expansion and contraction are all forms of structural movement. Buildings and other built structures are moving all the time, but usually these movements are so small they are unnoticeable.

Identifying structural movement

All building structures experience movement and most buildings develop cracks in their fabric at some stage. Only rarely does cracking indicate serious structural failure. Many owners are unaware of a problem until their house goes through the selling process, when a valuation report for a lender recommends that an Engineer's report is obtained. This can be an unwelcome surprise for many vendors.

Why Building Structures experience movement | Arnold & Baldwin

Settlement is: the downward movement of the site on which the building stands, due to the application of the superimposed load (weight) from the building . Settlement Settlement problems normally exhibit themselves in the early life of the structure so older properties seldom suffer from on-going settlement

A joint is the articulation, or junction, between two or more bones that acts as a pivot point for bony movement. Motion of the entire body or of a particular body segment generally occurs through the rotation of bones about individual joints.

Structure and Function of Joints | Musculoskeletal Key

Synovial joints allow the body a tremendous range of movements. Each movement at a synovial joint results from the contraction or relaxation of the muscles that are attached to the bones on either side of the articulation. The type of movement that can be produced at a synovial joint is determined by its structural type.

Structures which can show the sense of movement are structures which occur within, or immediately adjacent to, the fault zone. To understand these structures we therefore need to consider the stress and strain that exists within an actively moving fault zone. The fault zone itself is the primary structure which was caused by a Primary or First ...
