Programming languages that use the object-oriented approach have been around for quite a while now. Most of them use either a static or a dynamic type system. However, both types are very common in the industry. But, in spite of their common use in science and practice, only very few scientific studies have tried to evaluate the two type systems' usefulness in certain scenarios. There are arguments for both systems. For example, static type systems are said to aid the programmer in the prevention of type errors, and further, they provide documentation help for, there is an explicit need to annotate variables and methods with their respective types. This book describes a controlled experiment that was conducted to shed some light into the presented matter. Which of the type systems can live up to its promises? Is one of these better suited for a particular task? And which type system is the most supportive in a problem solving? The main hypothesis claims that a static type system is faster in a problem solving in use of an undocumented API. Thus, in the study, the participants need to solve different programming tasks in an undocumented API environment with the help of the static type system (Java), and the dynamic type system (Groovy). The author starts with a short introduction to the topic, the experimentation, and the motivation. Then, he describes a list of related works, and proceeds to the description of the experiment, its evaluation, and finally, the discussion of the results. This book should prove interesting reading for anyone who is interested in the mechanics that drive programmer productivity and performance that depend on the kind of technology used, as well as for anyone who might be interested in empirical research in software engineering, in general.

This combination textbook and workbook, explains each phase of the medical claim cycle, from the time the patient calls for an appointment until the financial transaction for the encounter is completed. Coverage includes types of insurance payers, basic coding and billing rules, and standard requirements for outpatient billing using the CMS-1500 claim form. It also emphasizes legal aspects related to each level of the medical claim cycle and the importance of the medical office employee, showing their responsibility for and impact on successful reimbursement. 3 separate chapters offer coverage of the basic concepts of medical coding. A comprehensive overview of the CMS-1500 claim form with step-by-step guidelines and illustrations thoroughly covers reimbursement issues and explains the billing process. Includes detailed information on various insurance payers and plans including Medicare, government medical plans, disability plans, private indemnity plans, and managed care. Stop & Review sections illustrate how the concepts presented in each chapter relate to real-life billing situations. Sidebars and Examples highlight key concepts and information related to the core text lesson. A companion CD-ROM contains sample patient and insurance information that readers can use to practice completing the accompanying CMS-1500 claim form, as well as a demonstration of Altapoint practice management software. Features completely updated information that reflects the many changes in the insurance industry. Contains a new chapter on UB-92 insurance billing for hospitals and outpatient facilities. Includes a new appendix, Quick Guide to HIPAA for the Physician's Office, to provide a basic overview of the important HIPAA-

Computer Aided Design of Multivariable Technological Systems covers the proceedings of the Second International Federation of Automatic Control (IFAC). The book reviews papers that discuss topics about the use of Computer Aided Design (CAD) in designing multivariable system, such as theoretical issues, applications, and implementations. The book tackles several topics relevant to the use of CAD in designing multivariable systems. Topics include quasi-classical approach to multivariable feedback system designs; fuzzy control for multivariable systems; root loci with multiple gain parameters; multivariable frequency domain stability criteria; and computational algorithms for pole assignment in linear multivariable systems. The text will be of great use to professionals whose work involves designing and implementing multivariable systems.
